Further preferred compounds in accordance with the definitions given above are those, wherein R³ is not alkoxy if R⁵ is hydrogen

The invention further relates to a process for the manufacture of compounds of formula I, which process comprises converting the nitrile group in a compound of formula II

II

5 wherein R¹, R², R³, R⁴ and X have the significances given above, into a carbamimidoyl group or into a N-hydroxy-carbamimidoyl group and, if desired, modifying a reactive group present in an obtained compound of formula I and, if desired, converting a compound of formula I obtained into a physiologically compatible salt or
10 converting a salt of a compound of formula I into the free acid or base.

Further the invention relates to compounds of formula I as defined above, when manufactured according to this process. In another embodiment the invention relates to compounds of formula II, wherein R¹, R², R³, R⁴ and X have the significances given above.

15 The conversion of the nitrile group in a compound of formula II into a carbamimidoyl group -C(NH)NH₂ or a N-hydroxy-carbamimidoyl group -C(NO₂)NH₂ can be carried out according to methods known per se. For example, the conversion into a N-hydroxy-carbamimidoyl group can be performed by dissolving a compound of formula II
20 in a solvent, such as DMF, ethanol or methanol, treating the solution with hydroxylamine or a salt of hydroxylamine with an inorganic acid, such as hydroxylamine hydrochloride, and thereafter with a base, such as diisopropylethylamine or triethylamine, sodium hydride or sodium methanolate, conveniently at a temperature up to 80°C.

The conversion of the nitrile group into a carbamimidoyl group can be carried out e.g. by treating a compound of formula II in a solvent, such as ethanol or methanol, or a solvent mixture, such as chloroform and methanol or chloroform and ethanol, with a dry stream of hydrogen chloride, conveniently at a temperature below 10°C, thereafter treating
5 the reaction solution with a solvent, such as diethyl ether, and filtering off the precipitated iminoether. The thus-obtained material is treated in a solvent, such as methanol or ethanol, either with gaseous ammonia or an ammonium salt, such as ammonium chloride, conveniently at a temperature up to 80°C. Alternatively, the solution containing the iminoether can be evaporated and the residue can be treated with gaseous ammonia or an
10 ammonium salt in methanol or ethanol. In an analogous manner, the iminoether can be converted into a N-hydroxy-carbamimidoyl compound of formula I with hydroxylamine or a salt thereof in the presence of a base.

As modifications of functional groups present in a compound of formula I there
15 come into consideration especially the conversion of a N-hydroxy-carbamimidoyl group into a carbamimidoyl group, the esterification of a carboxy group, the saponification of an ester group and the cleavage of an ether group, such as an arylalkyl ether group, e.g. the benzyl ether group. All of these reactions can be carried out according to methods known per se.

20

For the conversion of a N-hydroxy-carbamimidoyl group into a carbamimidoyl group, an amidoxime of formula I can be hydrogenated in a solvent, such as ethanol, methanol, dioxan, THF or glacial acetic acid, or a solvent mixture, such as ethanol and glacial acetic acid, with hydrogen and a catalyst, such as palladium, platinum or nickel. In
25 so doing, other reactive groups present in the compound of formula I and reactive towards the reducing agent can be modified.

By reacting a compound of formula I in which R⁵ represents hydrogen with a suitable chloroformic acid ester wherein a hydroxy or carboxy group can be present in
30 protected form, in a solvent, such as dichloromethane, dioxane or DMF, or a solvent mixture, such as dichloromethane and water or ethyl acetate and water; in the presence of an organic base, such as pyridine or triethylamine, or an inorganic base, such as sodium hydroxide, sodium carbonate or potassium hydrogen carbonate, there is obtained the corresponding compound of formula I in which R⁵ as described above represents
35 alkoxycarbonyl, halogenalkoxycarbonyl, aryloxy carbonyl, arylalkoxycarbonyl, alkoxyalkoxycarbonyl, cycloalkyloxy carbonyl, alkynyloxy carbonyl or a similar group.

comprising an oxycarbonyl structure. Analogously, a compound of formula I in which R^5 represents hydrogen can be converted with a suitable p-nitrophenyl carbonate into the corresponding compound of formula I in which R^5 as described above represents a group comprising an oxycarbonyl structure. The reaction can e.g. be carried out by treating the p-nitrophenyl carbonate in THF and DMF firstly with N,N-diisopropylethylamine and then with a compound of formula I in which R^5 represents hydrogen.

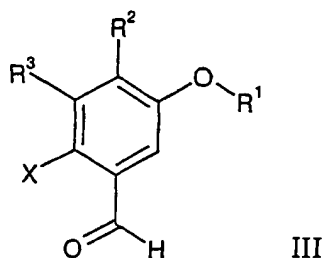

By reacting a compound of formula I in which R^5 represents hydrogen with an acyl chloride, such as an aroyl chloride, there is obtained the corresponding compound of formula I in which R^5 as defined before represents an acyl group. The reaction can e.g. be carried out by treating the acyl chloride in THF and DMF firstly with N,N-diisopropylethylamine and then with a compound of formula I in which R^5 represents hydrogen.

By reacting a compound of formula I in which R^5 represents hydroxy with an acyl halide there can be obtained a compound of formula I in which R^5 as defined above represents arylcarbonyloxy or a similar group comprising a carbonyloxy structure. The reaction can e.g. be carried out by treating the acyl chloride in THF and DMF firstly with N,N-diisopropylethylamine and then with a compound of formula I in which R^5 represents hydroxy.

By reacting a compound of formula I in which R^5 represents hydrogen with a suitable isocyanate there can be obtained a compound of formula I in which R^5 as described above represents a group comprising an aminocarbonyl structure. The reaction can be carried out by reacting a compound of formula I in which R^5 represents hydrogen with a suitable isocyanate in THF and DMF in the presence of triethylamine.

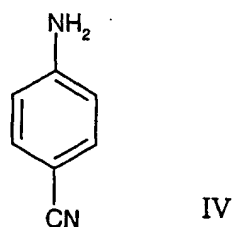

By reacting a compound of formula I in which R^5 represents hydroxy with a suitable isocyanate there can be obtained a compound of formula I in which R^5 as described above represents a group comprising an aminocarbonyloxy structure. The reaction can be carried out by reacting a compound of formula I in which R^5 represents hydroxy with a suitable isocyanate in THF.

The compounds of formula II can be prepared according to general methods known per se, e.g. as described hereinafter and/or as described in the Examples or in analogy to these methods. For example, an aldehyde of formula III

in which R^1 , R^2 , R^3 and X have the significances given above, can be reacted with a p-aminobenzonitrile of formula IV

5

and benzylisocyanide, toluenesulfonylmethylisocyanide, or morpholinoethylisocyanide, and a primary alkanol such as methanol or ethanol, in the presence of boron trifluoride etherate.

- 10 Hydrolysis of the resulting iminoether with water yields a compound of formula II in which R^4 represents methyl or ethyl. By hydrolysis of the ester group R^4 , e.g. by treatment with LiOH in tetrahydrofuran, there is obtained a compound of formula II in which R^4 represents hydrogen.

- 15 Further reactions for the preparation of compounds of formula II:

By reaction of compounds of formula II in which R^1 together with the connecting oxygen atom and/or one or more of R^2 - R^3 represent hydroxy:

- 20
- with an alkylating agent such as an alkyl bromide, alkyl iodide or alkyl mesylate in the presence of a base such as potassium carbonate or caesium carbonate in a solvent such as DMF or acetone, or
 - by a Mitsunobu reaction with an alcohol in the presence of DEAD, DIAD, or di-tert.-butyl-azodicarboxylate, and triphenylphosphine in a solvent
- 25 such as THF or dioxane, there are obtained compounds of formula II in which the hydroxy group is converted to an alkoxy group.

Compounds of formula III are known per se. They can be obtained e.g. by reacting compounds of formula III in which R^1 together with the connecting oxygen atom and/or one or more of $R^2 - R^3$:

5 represent a hydroxy group

- with an alkylating agent such as e.g. ethyl bromide in the presence of a base such as potassium carbonate oder caesium carbonate in a suitable solvent such as DMF or acetone, preferably at an elevated temperature, or
- in a Mitsunobu reaction with an alcohol in the presence of DEAD, DIAD, or di-tert.-butyl-azodicarboxylate, and triphenylphosphine in a solvent such as THF or dioxane, to give compounds of formula III in which the hydroxy group is substituted by an alkoxy group;

represent a silyloxy group

- with an alkylating agent such as e.g. an alkyl bromide in a suitable solvent such as e.g. DMF in the presence of potassium fluoride, to give compounds of formula III in which the silyloxy group is substituted by an alkoxy group.

20 Starting materials for the preparation of compounds of formula III are either commercially available or can be prepared by methods known in the art.

Insofar as their preparation is not described in the Examples, the compounds of formulae I, II, III and IV can be prepared according to analogous methods or according to the methods set forth above.

The compounds of formula I are active compounds and inhibit the formation of coagulation factors Xa, IXa and thrombin induced by factor VIIa and tissue factor or are derivatives which are converted under physiological conditions to such active compounds. These compounds consequently influence both platelet aggregation which is induced by these factors and plasmatic blood coagulation. They therefore inhibit the formation of thrombi and can be used for the control or prevention of diseases, such as thrombosis, apoplexy, cardiac infarction, inflammation and arteriosclerosis. Furthermore, these compounds have an effect on tumour cells and prevent metastases. They can therefore also be employed as antitumour agents.

10

Accordingly, the present invention also relates to pharmaceutical preparations comprising a compound as described above and a pharmaceutically acceptable carrier and/or adjuvant.

15

The invention likewise embraces compounds as described above for use as therapeutic active substances, especially as inhibitors of the formation of clotting factors Xa, IXa and thrombin induced by factor VIIa and tissue factor, particularly as therapeutic active substances for the treatment or prevention of thrombosis, apoplexy, cardiac infarction, inflammation and/or arteriosclerosis and/or as an antitumour agent.

20

In another preferred embodiment, the invention relates to a method for the therapeutic and/or prophylactic treatment of thrombosis, apoplexy, cardiac infarction, inflammation, arteriosclerosis and/or tumour, which method comprises administering a compound as defined above to a human being or animal.

25

The invention also embraces the use of a compound as defined above for the treatment or prophylaxis of thrombosis, apoplexy, cardiac infarction, inflammation, arteriosclerosis and/or tumour.

30

The invention also relates to the use of a compound as described above for the preparation of medicaments for the treatment or prevention of thrombosis, apoplexy, cardiac infarction, inflammation and arteriosclerosis or of antitumour agents. Such medicaments comprise a compound as described above.

The inhibition of the amidolytic activity of factor VIIa/tissue factor complex by the compounds in accordance with the invention can be demonstrated with the aid of a chromogenic peptide substrate as described hereinafter.

5 The measurements were carried out on microtitre plates at room temperature. To this end, 100 μ l of a solution of 26 nM of tissue factor, 9 nM of soluble factor VIIa and 8 mM of calcium chloride were added to 25 μ l of a solution of the inhibitor in a buffer [pH 7.5, 100 mM, comprising 0.14M NaCl, 0.1M N-(2-hydroxyethyl)piperazine-N'-(2-ethanesulphonic acid) (HEPES), 0.5 mg/l of fatty-acid-free BSA (bovine serum albumin) and 0.05% NaN₃] in each well of the plate. After an incubation time of 10 15 minutes the reaction was started by the addition of 50 μ l of chromogenic substrate Chromozym-tPA (3.5 mM, MeSO₂-D-Phe-Gly-Arg-paranitroanilide) and the hydrolysis of the substrate was followed spectrophotometrically on a kinetic microtitre plate reader over 10 minutes. Using the plot of the inhibition curves, the K_i values were determined 15 according to the method described in Biochem. J. 55, 1953, 170-171.

The activity of the low molecular weight substances can, moreover, be characterized in the "prothrombin time" (PT) clotting test. The substances are prepared as a 10 mM solution in DMSO or DMSO/0.1M HCl (DHCl) and thereafter made up to the desired 20 dilution in the same solvent. Thereafter, 0.25 ml of human plasma (obtained from whole blood anticoagulated with 1/10 volume of 108 mM Na citrate) was placed in the instrument-specific sample container. In each case 5 μ l of each dilution of the substance-dilution series was then mixed with the plasma provided. This plasma/inhibitor mixture was incubated at 37°C for 2 minutes. Thereafter, there were pipetted to the semi-automatic 25 device (ACL, Automated Coagulation Laboratory (Instrument Laboratory)) 50 μ l of plasma/ inhibitor mixture in the measurement container. The clotting reaction was initiated by the addition of 0.1 ml of Innovin® (recombinant human tissue factor combined with calcium buffer and synthetic phospholipids(Dade Behring®, Inc.). The time up to the fibrin cross-linking was determined photooptically from the ACL. The 30 inhibitor concentration, which brought about a doubling of the PT clotting time, was determined by means of a graph.

The K_i value of the active compounds of the present invention preferably amounts to about 0.1 to 500 nM, especially about 0.1 to 150 nM. The PT values preferably amount to 35 about 0.1 to 10 μ M, especially to about 0.1 to 5 μ M.

As mentioned earlier, medicaments containing a compound of formula I, a solvate or a salt thereof also form an object of the present invention, as does a process for the production of such medicaments which comprises bringing one or more of such
5 compounds, solvates or salts and, if desired, other therapeutically useful substances into a galenical administration form. These medicaments can be administered orally, e.g. in the form of dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions, or rectally, for example in the form of suppositories, or as a spray. However, administration can also be carried out parenterally, e.g. in the form of injection solutions.

10

For the production of tablets, coated tablets, dragées and hard gelatine capsules, the active ingredient can be mixed with pharmaceutically inert, inorganic or organic excipients. Suitable excipients for tablets, coated tablets, dragées and hard gelatine capsules are, for example, lactose, maize starch or derivatives thereof, talc, stearic acid or its salts. Suitable
15 excipients for soft gelatine capsules are, for example, vegetable oils, waxes, fats, semi-solid and liquid polyols; depending on the nature of the active ingredient no excipients are, however, usually required in the case of soft gelatine capsules. Suitable excipients for the production of solutions and syrups are e.g. water, polyols, sucrose, invert sugar and glucose; suitable excipients for injection solutions are e.g. water, alcohols, polyols, glycerol
20 and vegetable oils, and suitable excipients for suppositories are natural and hardened oils, waxes, fats, semi-liquid or liquid polyols. In addition, the pharmaceutical preparations can also contain preservatives, solubilizers, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavorants, salts for varying the osmotic pressure, buffers, coating agents or
antioxidants.

25

The dosage of the active ingredient for the control or prevention of the illnesses mentioned above can vary within wide limits and will, of course, be adapted to the individual requirements in each particular case. In general, in the case of oral or parenteral, e.g. intravenous or subcutaneous, administration, a dose of about 0.1 to
30 20 mg/kg, preferably about 0.6 to 5 mg/kg, per day should be adequate for adults, although the upper limit which has just been mentioned may be exceeded or the dose may be lower when this is shown to be indicated.

The following examples shall illustrate in more detail the present invention and
35 preferred embodiments thereof but are not intended to limit the scope of the invention.
